1. MODEL

Government choices Main problem in repayment

$$\begin{aligned}
 V^R(b, a, \mathbf{s}) &= \max_{b', a', c_T, h} u(c_T, F(h)) + \beta \mathbb{E} [\mathcal{V}(b', a', \mathbf{s}')] \\
 &\text{subject to } c_T + q_a a' + \delta b = a + y_T(\mathbf{s}) + q_b(b', a', \mathbf{s})(b' - (1 - \delta)b) \\
 &\quad h \leq \mathcal{H}(c_T, \bar{w})
 \end{aligned} \tag{1}$$

Main problem in default

$$\begin{aligned}
 V^D(b, a, \mathbf{s}) &= \max_{a', c_T, h} u(c_T, F(h)) + \beta \mathbb{E} [\theta \mathcal{V}(b, a', \mathbf{s}') + (1 - \theta) V^D(b, a', \mathbf{s})] \\
 &\text{subject to } c_T + q_a a' = a + \mathcal{D}(y_T(\mathbf{s})) \\
 &\quad h \leq \mathcal{H}(c_T, \bar{w})
 \end{aligned} \tag{2}$$

Extreme value preference-for-default shocks yields a default probability

$$\mathcal{P}(b, a, \mathbf{s}) = \frac{\exp(V^D((1 - \bar{h})b, a, \mathbf{s})/\kappa)}{\exp(V^D((1 - \bar{h})b, a, \mathbf{s})/\kappa) + \exp(V^R(b, a, \mathbf{s})/\kappa)} \tag{3}$$

Finally, the value of entering a period with access to markets (and hence an option to default) is

$$\mathcal{V}(b, a, \mathbf{s}) = (1 - \mathcal{P}(b, a, \mathbf{s})) V^R(b, a, \mathbf{s}) + \mathcal{P}(b, a, \mathbf{s}) V^D((1 - \bar{h})b, a, \mathbf{s}) \tag{4}$$

Foreigners, debt prices Stochastic discount factor

$$m(\mathbf{s}, \mathbf{s}') = \exp(-r - \nu(\psi \epsilon' + 0.5 \psi^2 \sigma_\epsilon^2)) \quad \epsilon' = \log(y') - \rho \log(y) - (1 - \rho) \mu_y \tag{5}$$

$$q_a = \exp(-r) \tag{6}$$

$$q_b(b', a', \mathbf{s}) = \mathbb{E} [m(\mathbf{s}, \mathbf{s}') (\mathcal{P}(b', a', \mathbf{s}')(1 - \bar{h})q_b(b', a', \mathbf{s}') + (1 - \mathcal{P}(b', a', \mathbf{s}'))(\delta + (1 - \delta)q_b(b', a', \mathbf{s}')))] \tag{7}$$

Private economy Preferences

$$u(c_T, c_N) = \left[\varpi_N c_N^{-\eta} + \varpi_T c_T^{-\eta} \right]^{-\frac{1}{\eta}} \tag{8}$$

for $\varpi_N + \varpi_T = 1$.

Production and default costs

$$y_N(h) = h^\alpha \tag{9}$$

$$\mathcal{D}(y) = y(1 - \Delta) \tag{10}$$

Wage rigidities

$$h \leq \mathcal{H}(c_T, \bar{w}) \quad \mathcal{H}(c_T, \bar{w}) = \left(\frac{\varpi_N \alpha}{\varpi_T \bar{w}} \right)^{\frac{1}{1+\alpha\eta}} c_T^{\frac{1+\eta}{1+\alpha\eta}} \tag{11}$$
